

CLIENT CAPABILITY OVERVIEW

POLYNOVEA

Intelligence System — Module 2 & Module 3

CONTENTS

OVER VIEW

A structured walkthrough of Polynovea's
intelligence infrastructure for venue growth.

01

Behavioral Intelligence Framework

Understanding customer behavior to acquire the right audience for your
venue

02

Optimisation System

Converting live intelligence into measurable revenue and experience
improvements

01

BEHAVIORAL INTELLIGENCE FRAMEWORK

Understanding customer behavior to acquire the right audience for your venue

The Real Problem Venues Face

Most venues operate on intuition and anecdotal feedback. They cannot reliably answer the questions that determine revenue.

Operational Blindness

Nobody can measure what live entertainment is actually doing to business outcomes

Fragmented Feedback

Decisions based on staff observations and occasional reviews treated as isolated opinions

Weak Measurement

Shallow metrics like total covers and weekly revenue miss the behavioral mechanics underneath

Unknown Churn Drivers

No structured understanding of what causes customers to return versus leave permanently

"Venues were making expensive decisions without understanding the behavioral mechanics underneath those decisions."

What Is the Behavioral Intelligence Framework

The framework is **not a data scraper** — it is behavioral enrichment infrastructure.

It transforms raw customer signals from reviews, ratings, and platform data into structured behavioral intelligence.

Instead of classifying keywords, the system maps **semantic relationships** between behavioral signals — identifying how environmental, emotional, and operational factors interact to shape customer decisions.

WHAT IT IS NOT

- ✗ Sentiment analysis (positive / negative)
- ✗ Keyword frequency counting
- ✗ Shallow categorical tagging
- ✗ Raw data collection without structure
- ✗ Generic review aggregation
- ✗ Intuition-driven recommendations

THE CORE PRINCIPLE

Reviews are not opinions waiting to be categorized. They are compressed behavioral events containing environmental context, emotional state, operational observations, social dynamics, and retention signals.

How the System Works — From Signal to Intelligence

A six-layer pipeline that transforms public behavioral signals into commercial intelligence.

What the Pipeline Extracts

- **Behavioral clusters** — patterns of customer action and response
- **Environmental signals** — how physical space influences behavior
- **Operational friction** — service conditions that degrade experience
- **Retention indicators** — signals of return intent vs. churn

Scale of Operation

7,000+

reviews analyzed through API infrastructure

The system extracts behavioral signals from thousands of reviews and maps them into interconnected behavioral clusters — not isolated data points.

From Intelligence to Customer Acquisition

Extracted behavioral signals become decision infrastructure for targeted customer acquisition.

Acquisition Hypotheses

Which audience segments, venue types, and behavioral profiles represent the highest-value acquisition opportunities

Positioning Strategy

How to position your venue relative to observed audience behavioral patterns and competitive gaps

Campaign Direction

What acquisition messaging and targeting approaches resonate with identified behavioral profiles

Audience Targeting

Which customer types to prioritize based on behavioral signal analysis and spending pattern matching

Retention Opportunities

Specific conditions and interventions likely to improve customer return rates and loyalty formation

Monetization Signals

Where spending behavior can be improved through environmental, operational, or experience changes

These are not reports. They are **inputs into optimization systems** that continuously improve acquisition outcomes.

Precision Targeting — Reaching the Right Customer

Behaviorally-grounded customer acquisition — not broad demographic guesses.

What the Framework Identifies

Demand Signals

What audiences are actually seeking versus what venues currently provide

Audience Composition Effects

How audience mix affects venue outcomes — because the population is a variable

Spending Triggers

What conditions trigger spending behavior changes across different environments

Retention vs. Churn Conditions

What produces loyalty formation versus permanent customer loss

THE OUTCOME

Specific Targeting Marketing

Instead of broad demographic campaigns, the framework enables **very specific targeting**:

- Match the right audience to the right venue experience
- Message based on observed behavioral patterns
- Acquire customers with proven spending affinity
- Reduce churn through condition-aware operations

02

OPTIMISATION SYSTEM

Converting live intelligence into measurable revenue and experience improvements

Venue & Experience Intelligence Layer

Real data collection instruments that create a complete operational picture of your venue.

POS Data

Sales patterns, ordering behavior, and revenue by time slot to identify peak performance windows

Venue Climate

Temperature, sound levels, and spatial data that shape the customer sensory experience

Live CX Feedback

Real-time and post-show customer feedback capturing immediate behavioral responses

Behavior Tracking

Table and customer movement, dwell time, and grouping patterns across the venue floor

Operational Patterns

Daily patterns across different show types and formats to identify what drives repeat visits

Background Intelligence

Psychological framework informing data interpretation

The difference between **observing behavior** and **understanding why** the behavior is occurring.

The Show Engineering Engine

Actively engineering the live show experience using venue data and behavioral intelligence.

Variable Identification

Identifies which variables in the live environment produce which behavioral outcomes — from sound levels to set timing to audience density.

Show Structure Design

Designs show structures, set formats, and environmental conditions to produce target audience responses — not guesswork.

Executable Playbooks

Converts raw behavioral data into executable show playbooks that any operator can follow with predictable outcomes.

LONG-TERM GOALS

- 1 Remove reliance on intuition-driven show design
- 2 Create repeatable show formats with predictable behavioral outcomes
- 3 Scale execution quality without founder or star-performer dependency
- 4 Feed intelligence back into Module 2 for ongoing framework improvement

Intelligence to Execution – The Closed Loop

Module 2 provides the intelligence layer. Module 3 provides the execution layer. Together, continuous improvement.

POLYNOVEA INTELLIGENCE SYSTEM
